BowTie Server

enterprise barrier management

Enterprise barrier based risk management

Does your organization struggle to streamline risk management across all facilities and divisions? BowTieServer is the enterprise barrier based risk management solution that provides overview to optimize decision making. Ideal for multi-division organizations that want to centrally gather all relevant risk management data. BowTieServer allows you to interact, share and report this information to the relevant person, whether it concerns workforce or board members. From Hazard Identification (HAZID) to action tracking, using BowTieServer results in a self-learning organization with better decision making and easier risk management.

Use BowTieServer to:

Communicate bowties across the organization

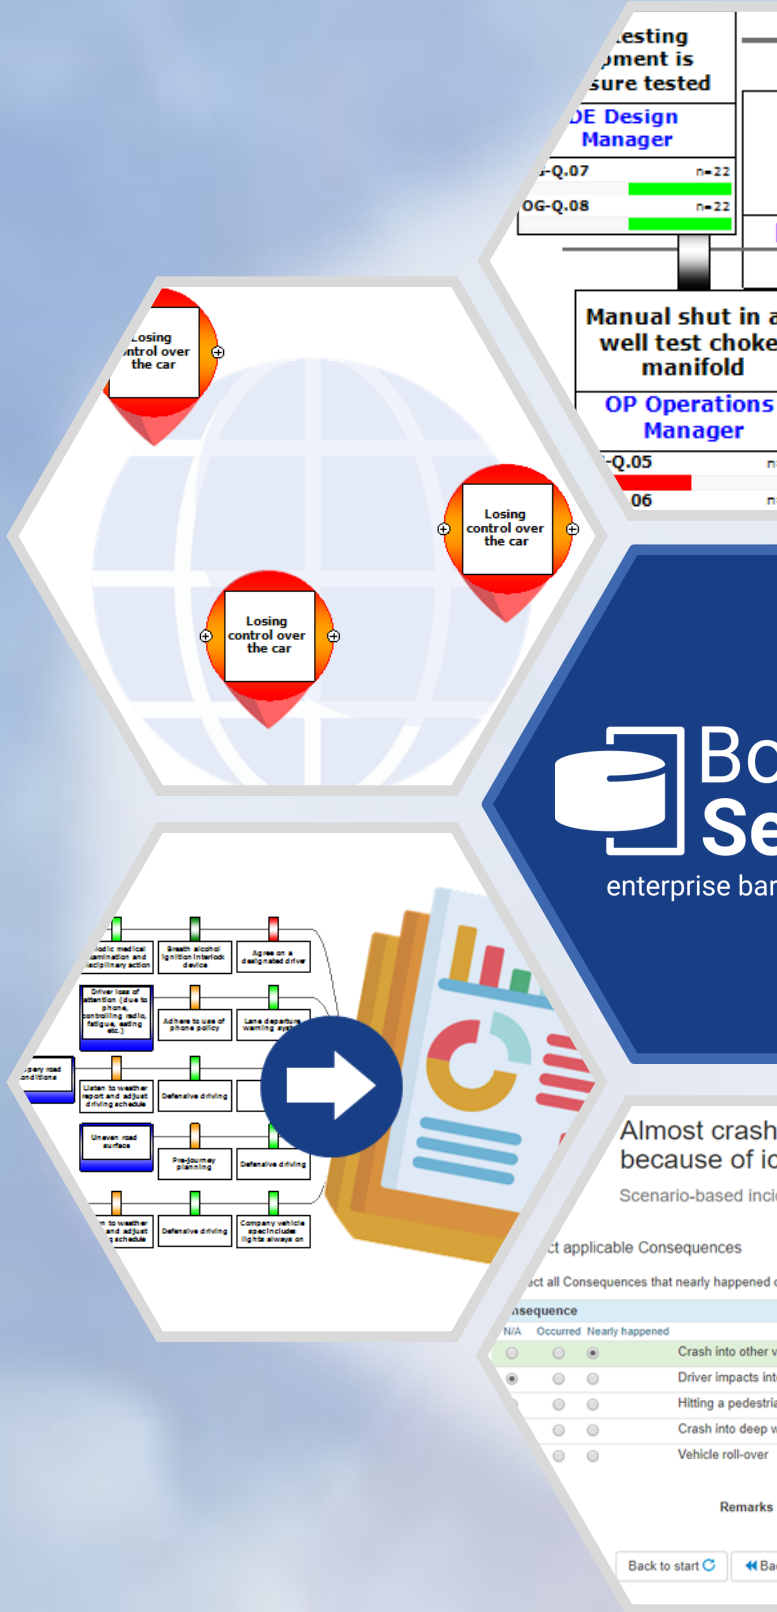
Visualizing risk scenarios with bowties helps you pass on the right information, emphasizing the most important parts. Using the webviewer, bowtie diagrams can be shared with the entire organization giving you the possibility to educate people and optimize risk awareness.

Make educated decisions

Discover and use the power of a wide variety of reports, allowing you to spot trends within all gathered data. Perform thorough analyses of specific trends and discover the strengths and weaknesses within your management systems. Make educated decisions and allocate your resources efficiently.

Learn more from incidents

Empower your staff to register incidents, accidents and even near misses by means of simple surveys based on pre-built bowties using the incidents module. Centralize this data and continuously improve the quality of your risk management and analyses, by spotting trends, monitoring progress and utilizing action. Ultimately leading the organization to a seamless process without incidents.



Proactively inspect barriers

Set up internal and external audits using the audit module*. Actively monitor your barrier performance to act on time and prevent negative consequences. Easily carry out recurring audits to constantly improve barrier integrity. Complete the cycle by assigning and tracking follow up actions based on audit findings. **AuditXP required*

Support your workforce

Make all relevant documents, instructions and paperwork available for your staff with the Wiki module. The Wikipedia-like encyclopedia pages can be linked to all relevant parts of bowties and the management system, lowering the threshold to refresh knowledge and making sure that operations are understood throughout the organization and executed correctly.

Start your work safely

Promote safety awareness using the work bowtie module to perform a task risk analysis. Before starting specific operations, let your workforce eliminate all the irrelevant scenarios and focus on the significant barriers to increase the level of safety and start the job risk-minded.

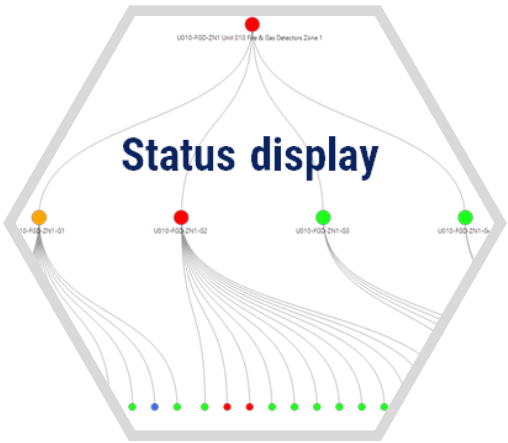
BowTieServer benefits:

Web based

Run BowTieServer on premise or choose for a hosted solution. Access the tool from anywhere in the world using your PC or mobile device.

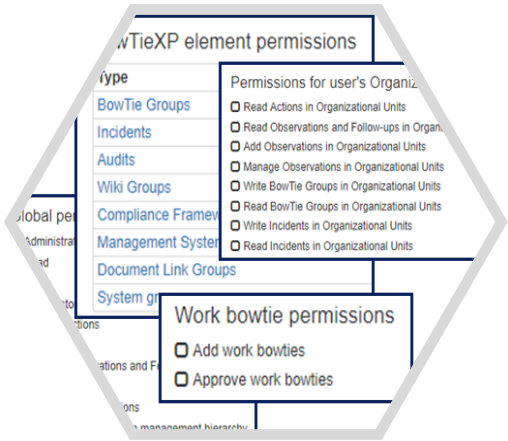
Linkable with external data sources

Link other data sources, like a maintenance system, to display online and offline statuses of maintenance tags. Bundle this information to create overview, displaying it all in one place.



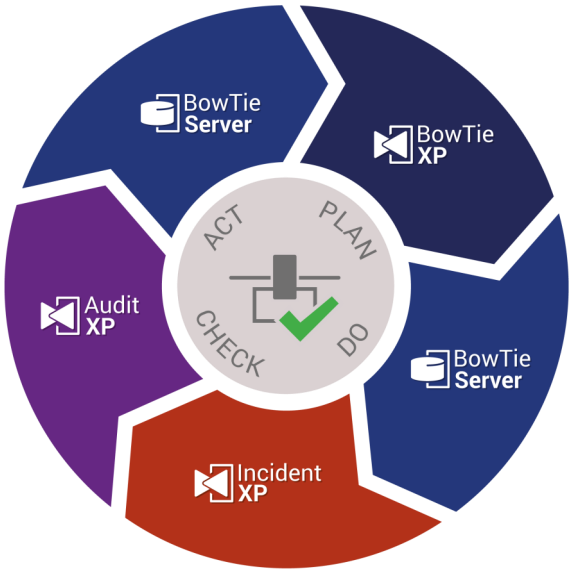
Advanced access control

Define users by their role within the organization and control which modules or relevant parts your staff can see and use. Simply log in to start at your own personal landing page.



Combined even more powerful

Use the power of the entire CGE portfolio. Visualize your risks with BowTieXP, inspect your barriers with AuditXP and learn from incidents with IncidentXP. Combine with BowTieServer to create synergy and continuously improve the quality of your risk management system.



Using its powerful modules, BowTieServer offers your organization the tools to take risk management to the next level. Contact Pace Up for an online demonstration.
